StoryCast: Documentation

Overview

A three-page microsite built with semantic HTML5, Sass compiled to CSS, and one small vanilla JavaScript file. No frameworks. The README has the file tree and the steps to run it.

HTML approach

- All pages include a header, nav, main, and footer. Article, aside, and figure are also used in story pages.
- h1: one for each page, h2: sections of the page, h3: cards.
- An audio element with my recording was used for the audio story. The video story includes a YouTube short embedded with a description of the content and also captions (which are turned on by default) and a credit.
- There are full transcripts for both stories. Each line is a button that will jump to a moment in the media;

Sass and CSS architecture

- The colors, typography, and spacing are stored in tokens: _colors, _typography, and _spacing.
- Layers: @layer reset, base, layout, components, and utilities are declared once; each partial will use its layer.
- The BEM philosophy is to move the data and information out of the HTML and into the CSS.

Responsive design

The page layout and card gallery are managed by grid, while the nav and button rows are managed by flexbox. The page layout and card gallery itself, is controlled by the grid, and the nav and button

rows are controlled by flexbox. The stories cards are placed in containers. The card will stack when the container is less than 34rem in size and slide next to the text when it is larger. The same card remains in the narrow related-stories column.

Accessibility

- Reduce motion: skip the link, thick focus outline (yellow ring), and animations.
- Text contrast exceeds the requirement of 4.5 to 1 and is at least 6.9 to 1 in body text and secondary text.
- Only use ARIA where necessary: aria-current, aria-label for the nav, and aria-labelledby for sections.

Limits

The video is an embed of a third party. Requires an internet connection; captions are dictated by the channel, so if you can record your own clip, a native video with .vtt would provide you with more control.

This is the author's recording of the audio story, which has been reduced to a small mono MP3. Transcript timestamps were set from the pauses in the recording, so recheck them if the audio is re-recorded.
